TITLE : PLASTIC LENS MATERIAL

ABSTRACT : PURPOSE: To provide the plastic lens material which has a high refractive index and Abbe number and has high strength and high heat resistance by using a polymer formed by polymerizing monomers introduced with alicyclic sulfide as a residual ester group.

CONSTITUTION: The plastic lens material consists of the polymer contg. the compd. expressed by general formula [I] as its essential monomer component. The monomer expressed by the general formula [I] includes 4-(meth) acryloxymethyl-1, 3-dithiorane and 2-(meth)acryloxymethyl-1, 4-dithiane. The preferable ratio of the monomer expressed by the general formula [I] is 50 to 100wt.%. Namely, the effect of enhancing the refractive index, strength and heat resistance is low if the ratio is below 50wt.%. The monomer used as the copolymer component is exemplified by a monofunctional monomer, monofunctional monomer, macromonomer, etc. The homopolymers having  $\geq 1.48$  refractive index are preferable.
